

LITERATURE on subtropical crops produced by the ARC-TSC

Books and manuals are suitable for subtropical fruit and nut farmers, horticulturists, students, consultants, extension officers and anyone who is interested in the subtropical fruit industry.

The range of textbooks, produced by researchers is an additional manner of technology transfer. Textbooks provide information on farming best practices and general cultivation methods.

Important aspects of commercial production are discussed including climatic and soil requirements, soil preparation, cultivars, irrigation and fertilization, pest and disease management, as well as post-harvest handling of crops.
