

BUSH ENCROACHMENT COLLOQUIUM

18th to 20th June 2024
at ARC-Animal Production
Roodeplaat Campus

Did you know? Bush encroachment affects 10-20 million hectares of South Africa, affecting biodiversity, sustainable land use, and food production. Without proper restoration, it will continue to harm rangeland productivity and biodiversity, impacting Sustainable Development Goals 15 (Life on Land), 13 (Climate Action), and 2 (Zero Hunger). But, we can still achieve some of these SDGS by using encroaching species as a resource especially for fodder production.

Discover solutions! Explore research and projects by the ARC-AP Range and Forage Science group tackling Bush encroachment.

Look forward to:

- *Keynote speakers*
- *Presentations*
- *Demonstrations*
